## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. **Claims 1, 2 and 7** are rejected under 35 U.S.C. 102(b) as being anticipated by US 3,448,750 to Parks.

Parks discloses a pressure relief arrangement including first and second housing portions (two ends of 10), first means (22) for applying compressive sealing force, and second means (14, 18) for responding to overpressure substantially as claimed. The second means is loaded in shear and becomes disintegral due to overpressure at a predetermine value.

### *Claim Rejections - 35 USC § 103*

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. **Claims 3-6** are rejected under 35 U.S.C. 103(a) as being unpatentable over Parks in view of US 4,553,559 to Short, III.

Art Unit: 3676

Parks discloses a plurality of rupture disks (14, 18) and a fourth means (16) which aligns the first and second means but does not disclose a third means, or reduced cross sections, to focus the applied forces on the rupture disks. **Short** teaches rupture disks (28) which become disintegral from overpressure at a predetermined value where the disks have reduced cross section portions (col. 3, lines 57-60) in order to focus the forces at weaker parts of the disk, thus disengaging the disk from the housings much easier. It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify Parks' invention with a third means of reduced cross section in order to provide specific weaker areas on the rupture disk to facilitate a cleaner blow out of the disk.

### *Conclusion*

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure: US 3,810,639 to Scannell, US 4,085,764 to Raidl, Jr., US 4,583,750 to Chabala et al., and US 4,733,872 to Sugimura.
